

SUNTIGHT®

Netwrap Replacement Film

Film dimensions:
1280mm x 20µm x 1650m

Suntight is made using our innovative pre-oriented technology, designed to replace netwrap in round silage bales. It is used in machines capable of applying film instead of netwrap.

Suntight provides an enhanced air barrier and helps to produce a denser bale by exerting a tighter grip around the crop as it is being baled. This results in a more compact bale and less chance of harmful oxygen being trapped within.

Suntight also offers additional bale protection than netwrap, helping to ensure an overall higher quality silage.

Suntight comes in easy to open sleeve packaging, which helps save time when changing reels, offers greater reel protection, and reduced packaging waste.

Film & Film Wrapping

Combi-wrapper technology allows for the replacement of netwrap with Suntight baler film, producing a tightly packed, dense bale of greater shape.

Silage bales then wrapped with SunFilm will further benefit from an enhanced oxygen barrier, greater puncture resistance, and tear resistance.

Making round bales using the Film & Film wrapping system ensures that bales can be opened easily. With no fodder becoming enmeshed, bale opening can be completed efficiently. Using either mechanical or manual techniques, no fodder is wasted.

Suntight's film and packaging can be recycled alongside Sunfilm wrap.
