CLINGS TO THE SURFACE OF THE CLAMP

CLINGSEAL

- Clings to the surface of the silage
- Reduces air pockets
- Reduction in surface spoilage

Typically, forage consists of anything between 40% and 80% of the diet in most dairy and beef production. Feed as a whole represents the largest single cost in this type of farming where reducing losses and maximising quality is the priority. This is why farmers and industry experts use Clingseal, a flexible vacuum sheet that is used directly beneath traditional, heavier silage sheets such as Visqueen Agri-S. It is thinner and therefore more flexible, allowing it to cling more closely to the contours of the clamp surface and tuck-in more at the sides. This helps eliminate air pockets and provides a close fitting barrier to significantly reduce top and shoulder losses from aerobic spoilage.

Additionally, because it provides a better air seal, Clingseal also facilitates a faster, more efficient fermentation process - delivering enhanced clamp silage quality. Clingseal is also easy to apply, and is suitable for a variety of ensiled crops, including grass, maize, wholecrop and other moist feeds.

Clingseal Cost comparison based on a value of £35 per tonne

Conclusion:

If a farmer has previously suffered surface spoilage deeper than 0.5cm, that alone should cover the cost of using Clingseal. This is before you factor in a rapid fermentation process and the resulting better quality silage
